Pterygium Surgery David Anderson commonly performs other corneal surgeries including pterygium surgery and amniotic membrane transplant surgery. Book a consultation today and find if you're suitable.

**Pterygium Surgery | Anderson Eye Care**

Pterygium removal surgery eliminates the abnormal tissue from the cornea and sclera (white of the eye). The older, standard surgical technique left a bare hole in the conjunctiva (the surface of the eye) where the pterygium was removed. Unfortunately, this led to a high rate of pterygium regrowth. A newer technique fills the gap in the conjunctiva left by the removal of the pterygium with a graft of tissue removed from under the eyelid.

**Pterygium Removal Surgery: What to Expect**

Surgery to remove a pterygium is minimally invasive and fairly quick — the entire procedure should take less than 30 minutes. You'll usually have local aesthetic prior to surgery and your eyes will be completely numb. Your doctor will remove the pterygium and replace it with a graft of tissue.

**Pterygium Surgery – Derby Eyes – Laser Eye Surgery**

The type of surgery most commonly used today involves a graft from the patient's own eye tissue to fill the empty space created by the removal of the pterygium. In this procedure, the pterygium is removed and the conjunctiva or amniotic membrane is glued or stitched onto the affected area.

**Pterygium - Eye Conditions - London Eye Unit**

A pterygium is a raised, triangular or wedge-shaped, benign growth of conjunctiva tissue. The conjunctiva is the mucus membrane that covers the front of your eye. It usually occurs on the side of your eye nearest your nose. A pterygium can grow over the cornea (the transparent dome at the front of your eyeball) in a triangular fashion.

**Pterygium - Guy's and St Thomas**

Conjunctival auto-grafting is a surgical technique that is an effective and safe procedure for pterygium removal. When the pterygium is removed, the tissue that covers the sclera known as the Tenons layer is also removed. Auto-grafting covers the bare sclera with conjunctival tissue that is surgically removed from an area of healthy conjunctiva.

Pterygium Surgery Pterygium Removal Eye Surgery in London A Pterygium is a fibrovascular, benign growth on the front surface of eye. It is thought to occur from long term sun exposure (especially if this occurred during childhood), and very occasionally causes significant visual loss.

**Pterygium Removal Eye Surgery London | LondonOC**

Pterygium, from the Greek pterygos meaning "wing", is a common ocular surface lesion originating in the limbal conjunctiva within the palpebral fissure with progressive involvement of the cornea. The lesion occurs more frequently at the nasal limbus than the temporal with a characteristic wing-like appearance.

**Pterygium - EyeWiki**

The key objectives of pterygium surgery are to remove the pterygium completely and achieve rapid post-surgical corneal re-epithelialization with minimal inflammation and scarring. Ultimately, these objectives should reduce the risk of recurrence, achieve the optimal cosmetic outcome and visual acuity, and leave the patient with no discomfort.

**Amniotic Membrane Use In Pterygium Surgery**

Surgery – is the only treatment that can remove a pterygium is surgery. The optometrist or doctor may refer you to an eye surgeon. It is preferable to remove the pterygium before it grows across the cornea. Otherwise, the pterygium may scar the cornea and cause permanent vision problems.

**Pterygium - Better Health Channel**

Normally, pterygium surgery will only be undertaken if the pterygium has severe symptoms or is affecting vision. Otherwise, management with eye drops is usually recommended. Pingueculae are rarely surgically removed and are usually treated with eye drops. However, if the pinguecula turns into a pterygium, surgery may be the best course.
