## Surds And Other Roots

When we have square roots which

give irrational numbers we call them surds. So  $\sqrt{2}$  and  $\sqrt[3]{3}$  are surds.

Other surds are  $\sqrt{5}$ ,  $\sqrt{6}$ ,  $\sqrt{7}$ ,  $\sqrt{8}$ ,  $\sqrt{10}$  and so on. Surds are often found when using Pythagoras' Theorem, and in trigonometry. So, where possible, it is useful to be able to simplify expressions involving surds. Take, for example,  $\sqrt{8}$ . This can be written as

Exponents and Roots, Radicals and Surds Further detail on taking roots is discussed in the module, Indices and logarithms. If  $a$  is a rational number, and  $n$  is a positive integer, any irrational number of the form  $\sqrt[n]{a}$  will be referred to as a surd. A real number such as  $\sqrt{2}$  will be loosely referred to as

Concerning the second matter, the Scottish mathematician George Chrystal (1851-1911) wrote in Algebra, 2nd ed. (1889) that "... a surd number is the incommensurable root of a commensurable number." He went on to explain that  $e$  is not a surd and neither is  $(1 + \sqrt{2})$  since  $e$  and  $(1 + \sqrt{2})$  are both irrational.

Surds Definition. Surds are the square roots ( ) of numbers which cannot be simplified into a whole or rational number. It cannot be accurately represented in a fraction. In other words, a surd is a root of the whole number that has an irrational value. Consider an example,  $\sqrt{2}$  1.414213. It is more accurate if we leave it as a surd  $\sqrt{2}$ .

Surds - Definition, Types, Rules, and Problems

Surds. When we can't simplify a number to remove a square root (or cube root etc) then it is a surd.

Example:  $\sqrt{2}$  (square root of 2) can't

be simplified further so it is a surd.

Example:  $\sqrt{4}$  (square root of 4) can be simplified (to 2), so it is not a surd!

In mathematics, an  $n$ th root of a number  $x$  is a number  $r$  which, when raised to the power  $n$ , yields  $x$ :  $r^n = x$ , where  $n$  is a positive integer, sometimes called the degree of the root. A root of degree 2 is called a square root and a root of degree 3, a cube root. Roots of higher degree are referred to by using ordinal numbers, as in fourth root, twentieth root, etc.. The computation of an  $n$ th root is a ...

Surds and Indices - Prepare For Bank  
Surds are numbers left in 'square root form' (or 'cube root form' etc). They are therefore irrational numbers. The reason we leave them as surds is because in decimal form they would go on forever and so this is a very clumsy way of writing them. The video below explains that surds are the roots of numbers that are not whole numbers.
