The p-value is a number, calculated from a statistical test, that describes how likely you are to have found a particular set of observations if the null hypothesis were true. P-values are used in hypothesis testing to help decide whether to reject the null hypothesis. The smaller the p-value, the more likely you are to reject the null

The traditional definition of P-value and statistical significance has revolved around null hypotheses, and we treat all other assumptions that are used to calculate P-value as if they are all correct.

A p -value higher than 0.05 (> 0.05) is not statistically significant and indicates strong evidence for the null hypothesis.

This means we retain the null hypothesis and reject the alternative hypothesis.
